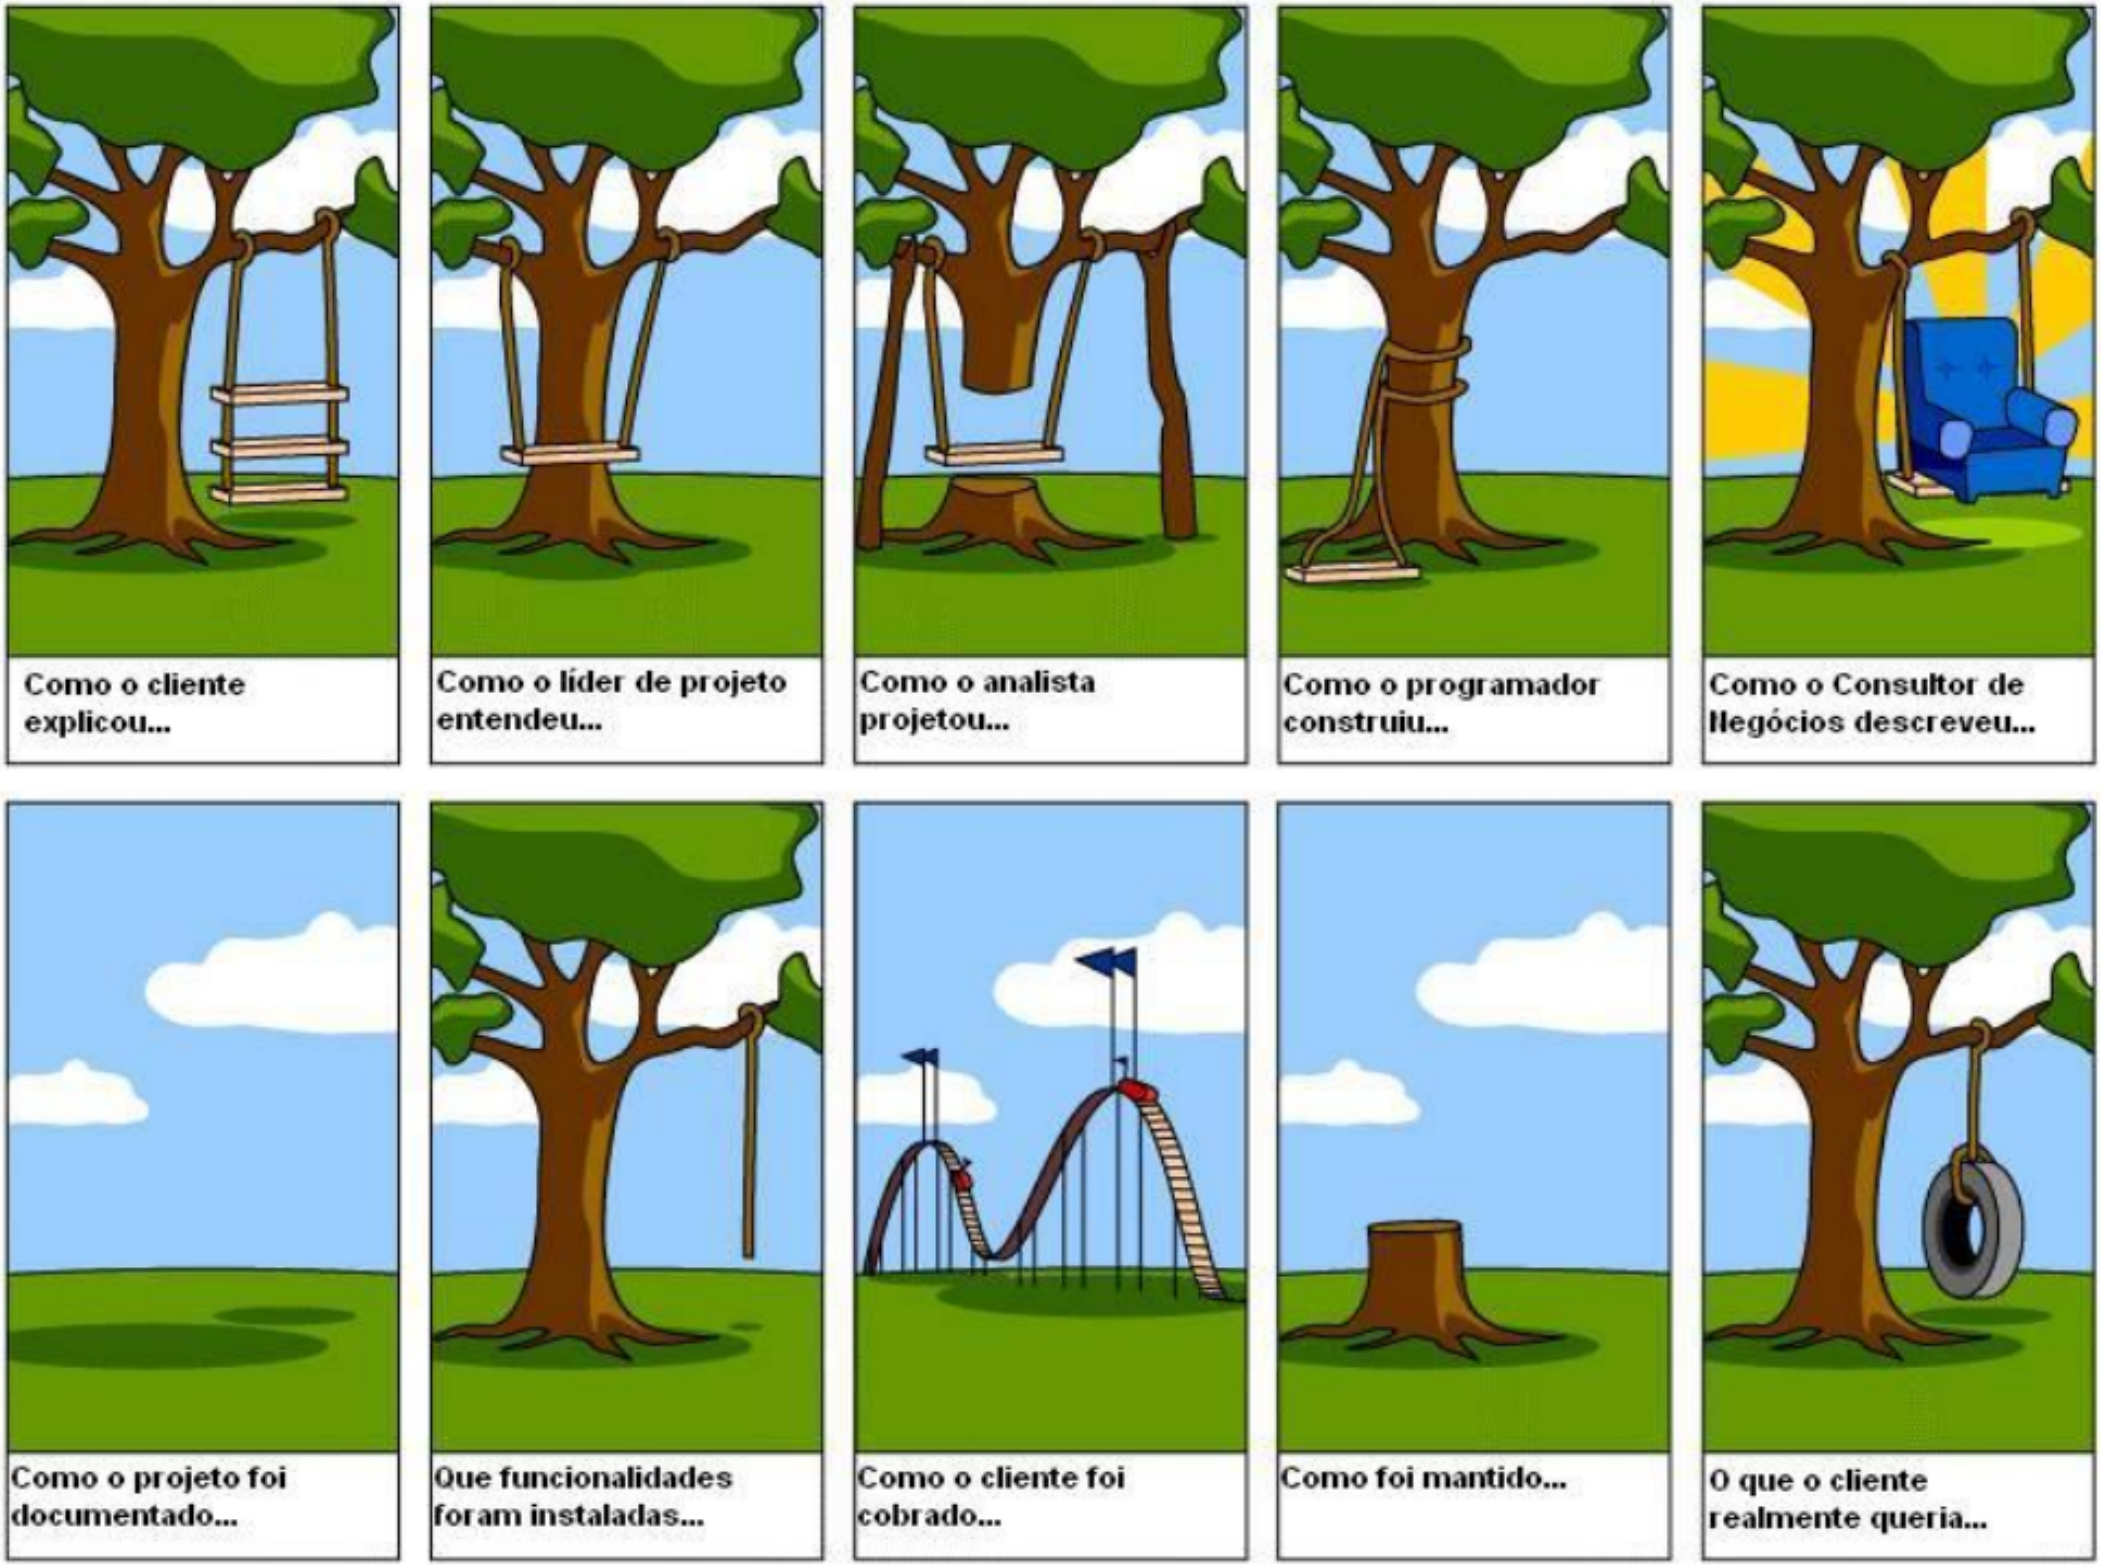
Parte 1: Conceitos

TestDox

```
Public class FooTest extends TestCase {
    public void testIsASingleton() {}
    public void testAReallyLongNameIsAGoodThing() {}
}
```

Foo
- is a singleton
- a really long name is a good thing



Como o cliente explicou...
Como o líder de projeto entendeu...
Como o analista projetou...
Como o programador construiu...
Como o Consultor de Negócios descreveu...
Como o projeto foi documentado...
Que funcionalidades foram instaladas...
Como o cliente foi cobrado...
Como foi mantido...
O que o cliente realmente queria...

palavras
pensamentos

“Getting the words right”

Palavra mágica:

should

```
public class CustomerLookupTest {
    @Test
    public void shouldFindCustomerById() { }
    @Test
    public void shouldFailForDuplicatedCustomers() { }
}
```

CustomerLookup

- should find customer by id

- should fail for duplicated customers

Ubiquitous Language para análise de software

Histórias
e
Cenários

História: Calculadora

Como uma criança inocente

Eu quero ter uma calculadora

Para que eu aprenda a fazer

operações matemáticas

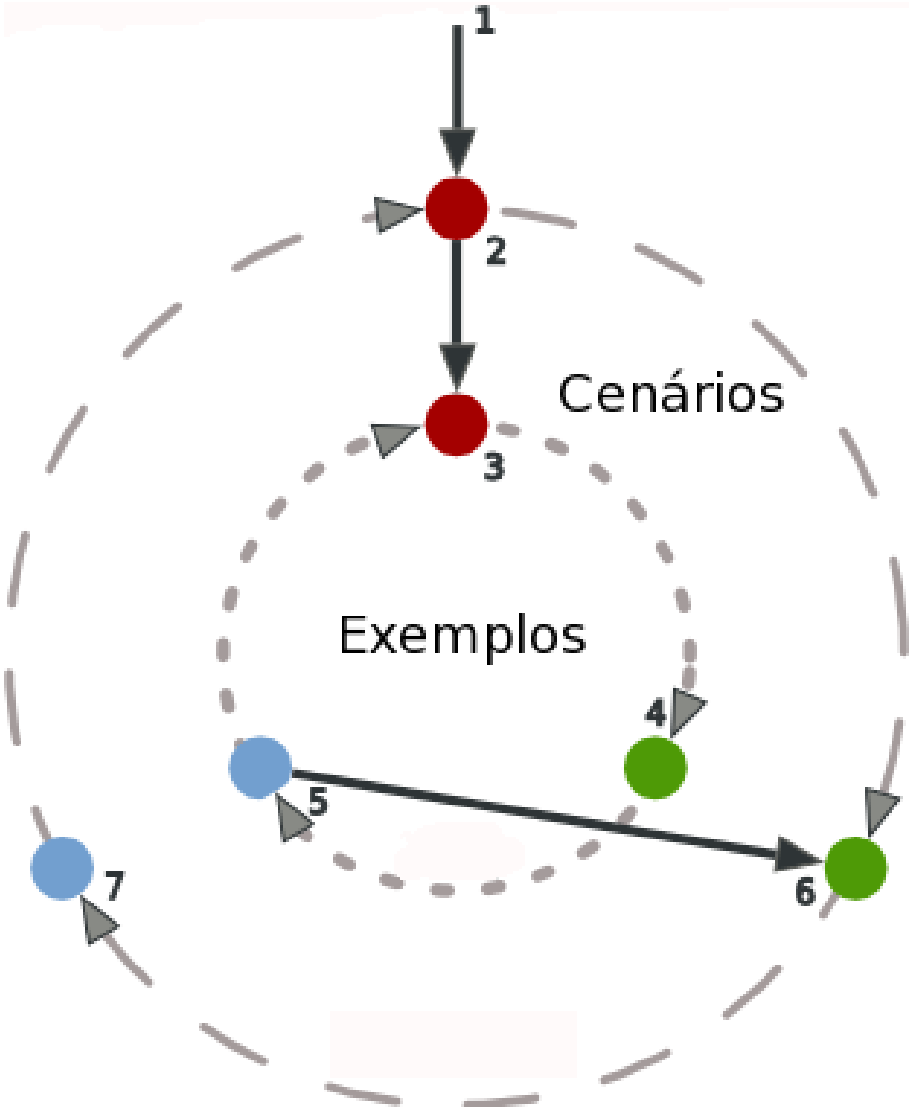
Cenário: Soma
Dado que eu tenho uma calculadora
Quando eu entro com 1 e 2
E aperto =
Então eu vejo 3 na tela

“It's all behaviour”

histórias e cenários → **aplicação**

exemplos → **código**

Outside-In Development



O que precisamos sempre manter em mente?

Specification,
not Verification

todo comportamento precisa de exemplos

WORLD'S
BEST
BOSS
EXIT

Benefícios

foco

Backspace
Insert
Delete
End
RUN!
Shift

documentação **correta**
em sincronia com o
código

Parte 2: Ferramentas em Python

Mock Frameworks

Mockito

```
from mockito import Mock, when, verify

class MaquinaDeSaque(object):
    @staticmethod
    def transferir(valor, conta1, conta2):
        if conta2.pegar_saldo() >= valor:
            conta2.sacar(valor)
            conta1.depositar(valor)

conta2 = Mock()
conta1 = Mock()
when(conta2).pegar_saldo().thenReturn(200)

MaquinaDeSaque.transferir(100, conta1, conta2)

verify(conta1).depositar(100)
verify(conta2).sacar(100)
```

Ludíbrio

```
from __future__ import with_statement
from ludibrio import Mock

class MaquinaDeSaque(object):
    @staticmethod
    def transferir(valor, conta1, conta2):
        if conta2.pegar_saldo() >= valor:
            conta2.sacar(valor)
            conta1.depositar(valor)

with Mock() as conta1:
    conta1.depositar(100)

with Mock() as conta2:
    conta2.pegar_saldo() << 200
    conta2.sacar(100)

MaquinaDeSaque.transferir(100, conta1, conta2)
```

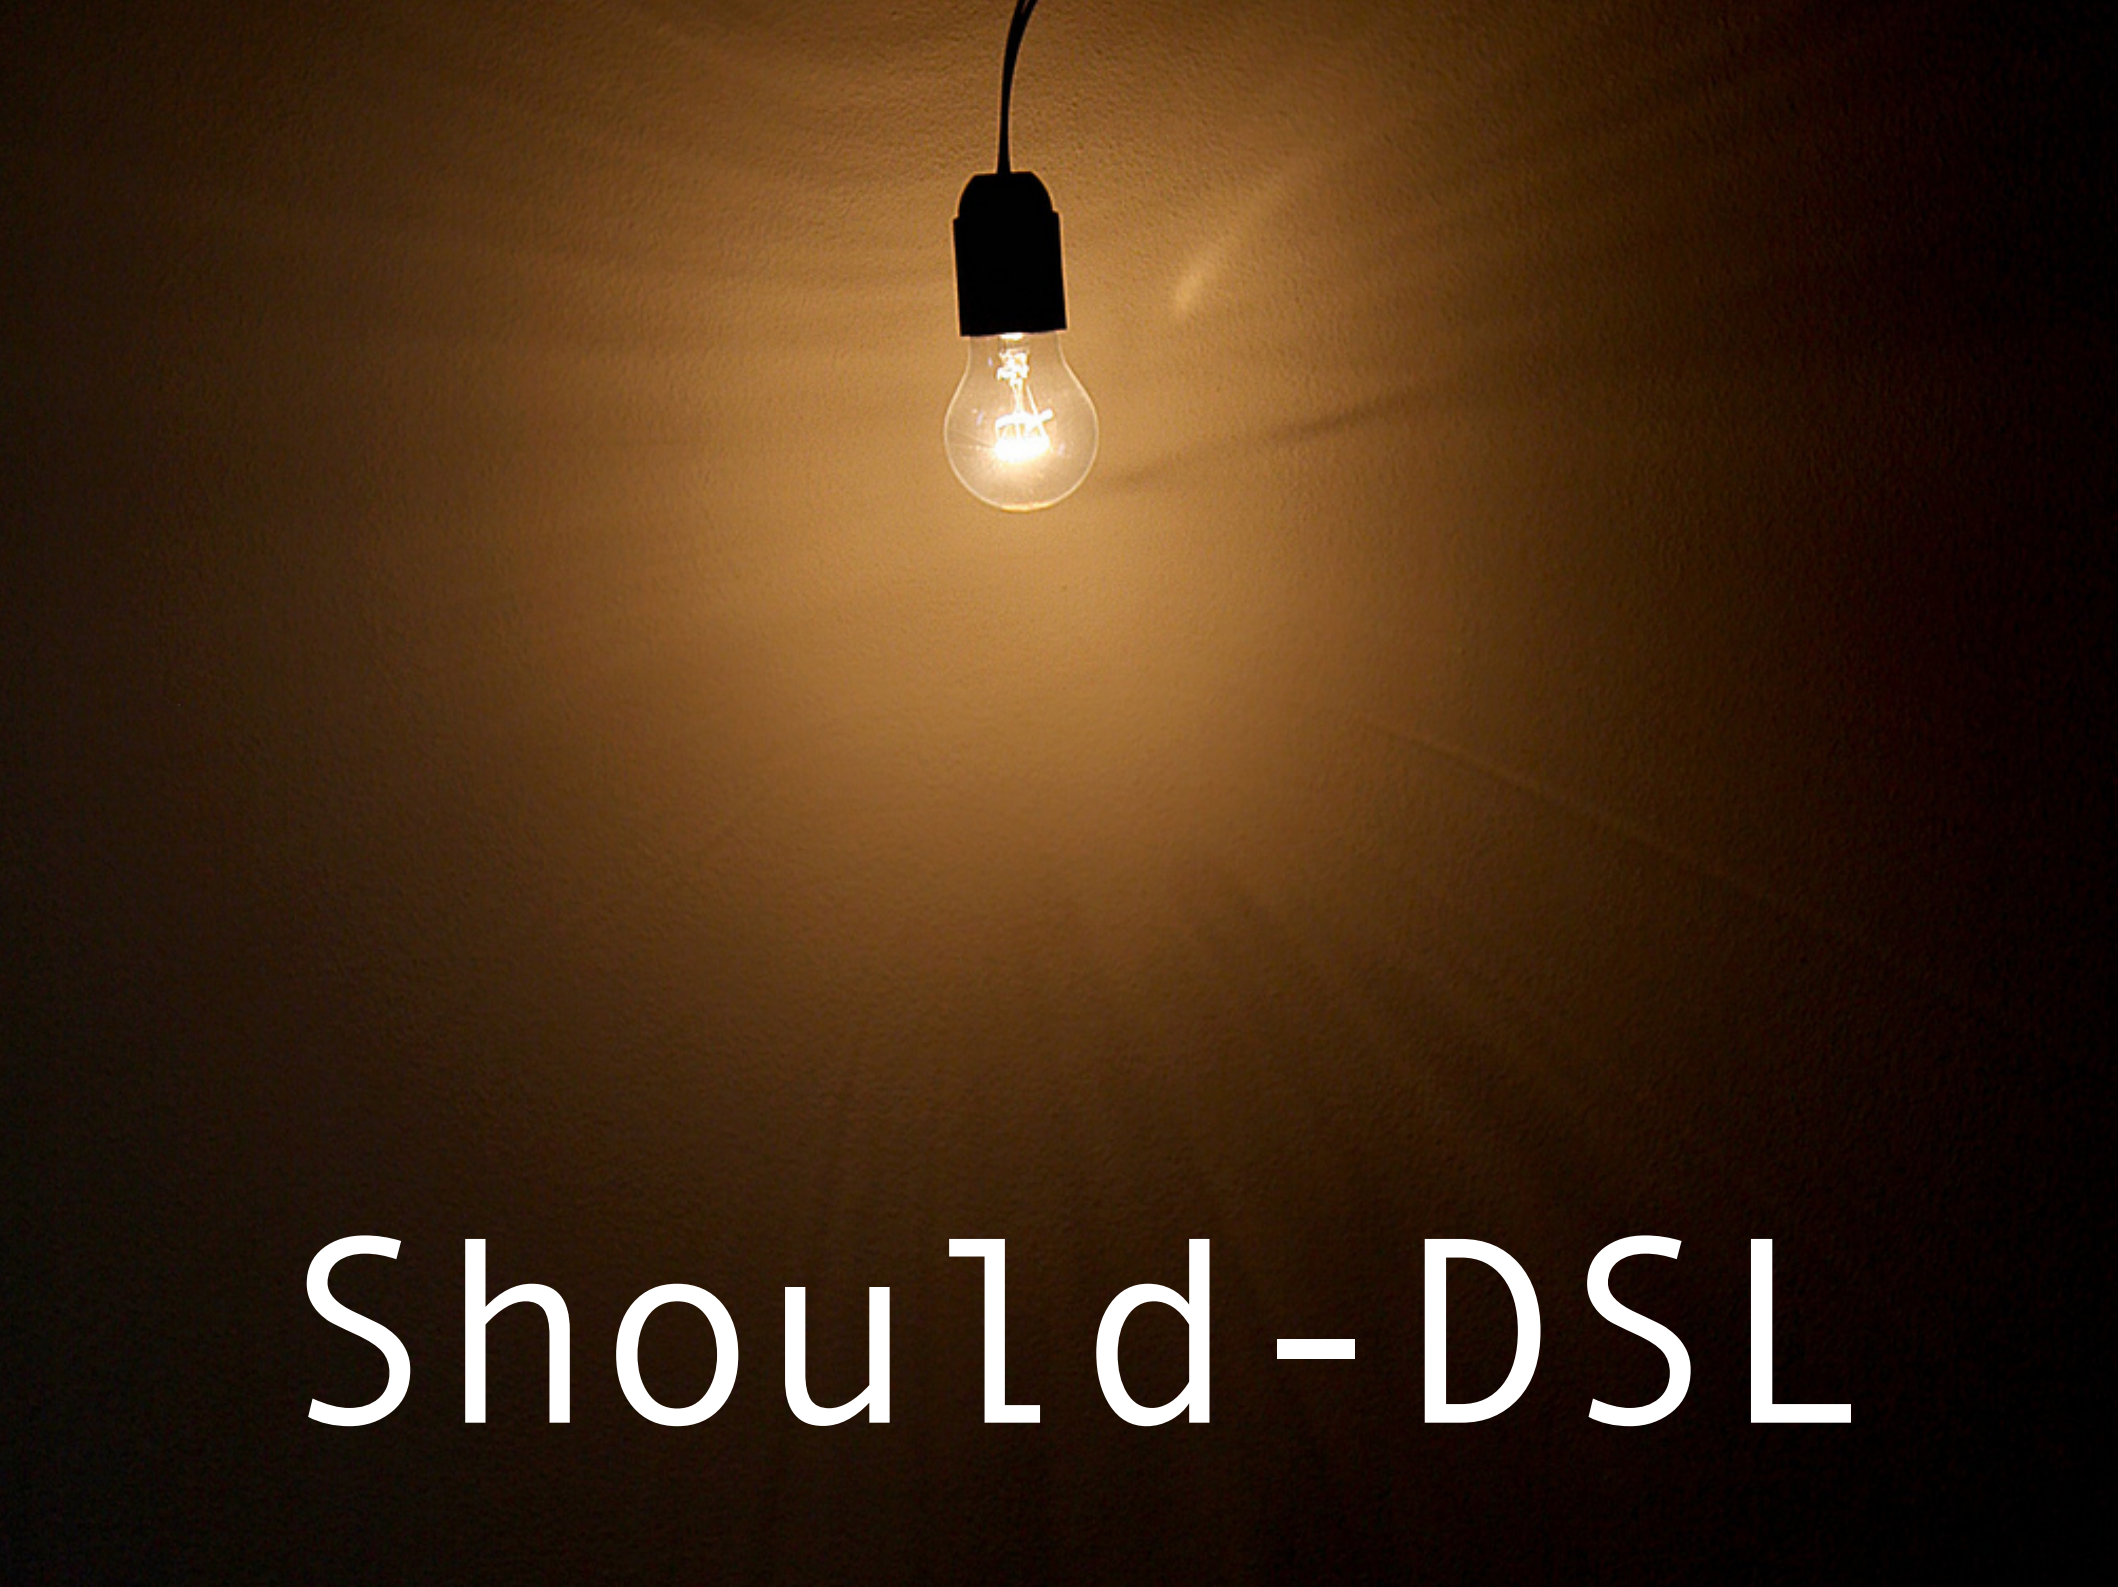
http://github.com/nsigustavo/ludibrio



Should-DSL

```
2 |should_be.greater_than| 1

'hugo' |should_not_be.equal_to| 'Hugo'

5 |should_be.less_than| 10

['python', 'C'] |should_have| 'python'

'C' |should_be.into| ['python', 'C']
```

```
assert 2 > 1

assert 'hugo' == 'Hugo'

assert 5 < 10

assert 'C' in '[python', 'C']
```

```
>>> from should_dsl import matcher, should_be

>>> @matcher
... def abs_of():
...     return lambda x, y: x == abs(y),\
...                 '%s is%s the abs of %s'
...

>>> 1 |should_be.abs_of| -1
True
```

```
>>> from math import sqrt

>>> deve_ser = should_be

>>> @matcher
... def a_raiz_quadrada_de():
...     return lambda x,y: x == sqrt(y),\
...                "%s %se' a raiz quadrada de %s"
...

>>> 2 |deve_ser.a_raiz_quadrada_de| 4
True
```

http://github.com/hugobr/should-dsl

Example Frameworks

XUnit ?

PySpec

behaviour_spec.py:

```
import stack          # import production code
from pyspec import * # import pyspec framework

class Behavior_Stack(object):
  @context
  def new_stack(self):
    self.stack = stack.Stack()

  @spec
  def should_be_empty(self):
    About(self.stack).should_be_empty()

if __name__ == "__main__":
  run_test()
```

stack.py:

```
class Stack(object):
  def __len__(self):
    return 0
```

```
$ python behavior_stack.py

new stack
    should be empty ... OK

----------------------------------
Ran 1 spec in 0.048s
OK
```

Behaviour

```
class verifyUserSpecification(behaviour.Behaviour):

    def setUp(self):
        self.user = User("Mark Dancer")

    def verifyInitialUserNameIsNameInConstructor(self):
        self.shouldBeEqual(self.user.name, "Mark Dancer")

    def verifyInitialUserHasNoLanguages(self):
        self.shouldBeEmpty(self.user.languages)
```

Yeti

```
# coding: spec
from should_dsl import should_be

class Bowling:
    score = 0
    def hit(self, v):
        self.score += v

describe Bowling:
    def before_each:
        self._bowling = Bowling()

    it "should score 0 for gutter game":
        self._bowling.hit(0)
        self._bowling.score |should_be.equal_to| 0

    it "should score 1 for just one hit":
        self._bowling.hit(1)
        self._bowling.score |should_be.equal_to| 1
```

http://pypi.python.org/pypi/Behaviour

http://github.com/fmeyer/yeti

Story/Feature Frameworks

Pyccuracy

```
As a Google User
I want to search Google
So that I can test Pyccuracy

Scenario 1 - Searching for Hello World
Given
  I go to "http://www.google.com"
When
  I fill "q" textbox with "Hello World"
  And I click "btnG" button
  And I wait for 2 seconds
Then
  I see "Hello World - Pesquisa Google" title
```

Pyhistorian

```
from should_dsl import *
from pyhistorian import *

class Calculator(object):
    def sum(self, n1, n2):
        return n1+n2

class SpecifyingMyNewCalculator(Story):
    """As a lazy mathematician
       I want to use a calculator
       So that I don't waste my time thinking"""
    colored = True
    template_color = 'yellow'
    scenarios = ['SumScenario'] # optional
```

Pyhistorian

```
class SumScenario(Scenario):
    @Given('I have a calculator')
    def set_my_calculator(self):
        self.calculator = Calculator()

    @When('I enter with 1 + 1')
    def sum_one_to_one(self):
        self.result = self.calculator.sum(1, 1)

    @Then('I have $value as result', 2)
    def get_result(self, value):
        self.result |should_be| value

if __name__ == '__main__':
    SpecifyingMyNewCalculator.run()
```

PyCukes

```
Story: Bowling Game
  As a bowling player
  I want to play bowling online
  So that I can play with everyone in the world

    Scenario 1: Gutter Game
      Given I am playing a bowling game
      When I hit no balls
      Then I have 0 points
```

PyCukes

```
from pycukes import *

class BowlingGame(object):
    score = 1
    def hit(self, balls):
        pass

@Given('I am playing a bowling game')
def start_game(context):
    context._bowling_game = BowlingGame()

@When('I hit no balls')
def hit_no_balls(context):
    context._bowling_game.hit(0)

@Then('I have 0 points')
def i_have_zero_points(context):
    assert context._bowling_game.score == 0
```

Freshen

```
Feature: Division
  In order to avoid silly mistakes
  Cashiers must be able to calculate a fraction

  Scenario: Regular numbers
    Given I have entered 3 into the calculator
    And I have entered 2 into the calculator
    When I press divide
    Then the result should be 1.5 on the screen
```

Freshen

```
Feature: Addition
  In order to avoid silly mistakes
  As a math idiot
  I want to be told the sum of two numbers

  Scenario Outline: Add two numbers
    Given I have entered <input_1> into the calculator
    And I have entered <input_2> into the calculator
    When I press <button>
    Then the result should be <output> on the screen

  Examples:
    | input_1 | input_2 | button | output |
    | 20      | 30      | add    | 50     |
    | 2       | 5       | add    | 7      |
    | 0       | 40      | add    | 40     |
```

Freshen

```
from freshen import *
from freshen.checks import *

import calculator

@Before
def before(sc):
    scc.calc = calculator.Calculator()
    scc.result = None

@Given("I have entered (\d+) into the calculator")
def enter(num):
    scc.calc.push(int(num))

@When("I press (\w+)")
def press(button):
    op = getattr(scc.calc, button)
    scc.result = op()

@Then("the result should be (.*) on the screen")
def check_result(value):
    assert_equal(str(scc.result), value)
```
